1 Introduction

1.1 BPL version

The hash of the GIT repository used for this benchmark is:

```
'651af563ce9915b3435f78a70dc053bdc7016f35'
```

The date and time of generation are:

```
'2026-03-16 08:49:30 +0100'
```

2 Benchmark suite

We describe here the tests used for the benchmark. We try to use tests showing different parts such as:

- pure calculus involving few memory management
- intensive memory management, e.g. creation of vectors and dynamically adding items into them
- intensive broadcast management in case of UPMEM arch, e.g. sending/returning a huge vector to/from the task

For each test, we will study the following:

- comparing Multicore vs Upmem in order to quickly compare the behaviour of the task for the two architectures
- the scalability for each available architectures. For the different tasks, we display as a function of process units number the ratio between the execution time for 1 process unit divided by the execution time for N process units. In a perfect world, one should be close to linearity. Note the following: for `multicore` arch, the unit process are threads and for `UPMEM` arch, process units are tasklets; in case of `UPMEM` arch and in order to have more readable `x` axis, we will display the number of ranks instead of tasklets.
- assessing execution times of the different parts during the running of a task with the `UPMEM` architecture.

The tests to be benchmarked are

```
SketchJaccardDistance
SketchJaccardDistanceOnce
SortSelection
SyracuseReduce
SyracuseVector
VectorChecksum
VectorChecksumOnce
VectorReverseInPlace
```

2.1 Test 'SketchJaccardDistance'

2.1.1 Description

```
Computes Jaccard distances between two sketches.
```

2.1.2 Remark

we first create a result vector of N items and populate it with [] for adding an item.

2.1.3 Benchmark-input

2^n for n in range(17,20)

2.1.4 Benchmark-split

yes (dbRef)

2.1.5 Source code

```
template<class ARCH>
struct SketchJaccardDistance : bpl::Task<ARCH>
{
    struct config  {
        static const int VECTOR_MEMORY_SIZE_LOG2 = 10;
        static const bool VECTOR_SERIALIZE_OPTIM = true;
    };

    USING(ARCH,config);

    using hash_t   = uint32_t;
    using count_t  = uint16_t;

    auto operator() (

    }
};
```

2.2.6 Multicore vs Upmem

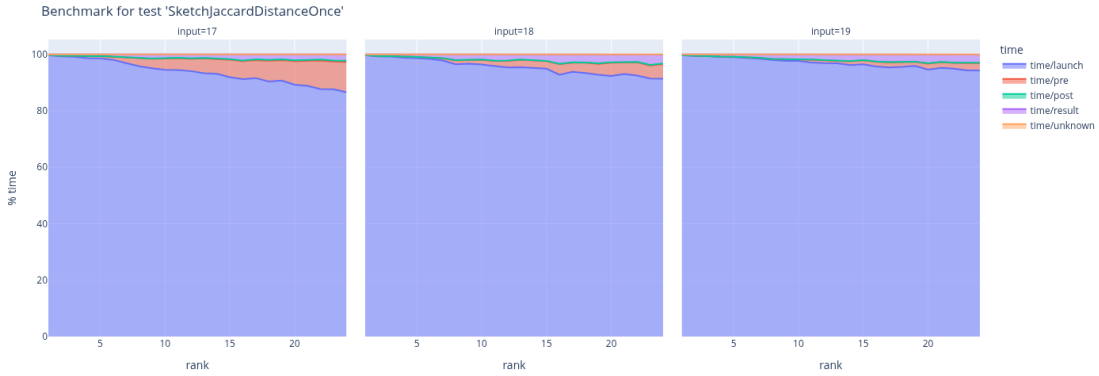

2.2.7 Scalability per architecture

2.2.8 Speedup upmem vs multicore

2.2.9 BPL overheads

2.3 Test 'SortSelection'

2.3.1 Description

Selection sort on a given array.

2.3.2 Benchmark-input

2^n for n in range(20,24)

2.3.3 Benchmark-split

yes (v)

2.3.4 Benchmark-multicore-split

1024

2.3.5 Source code

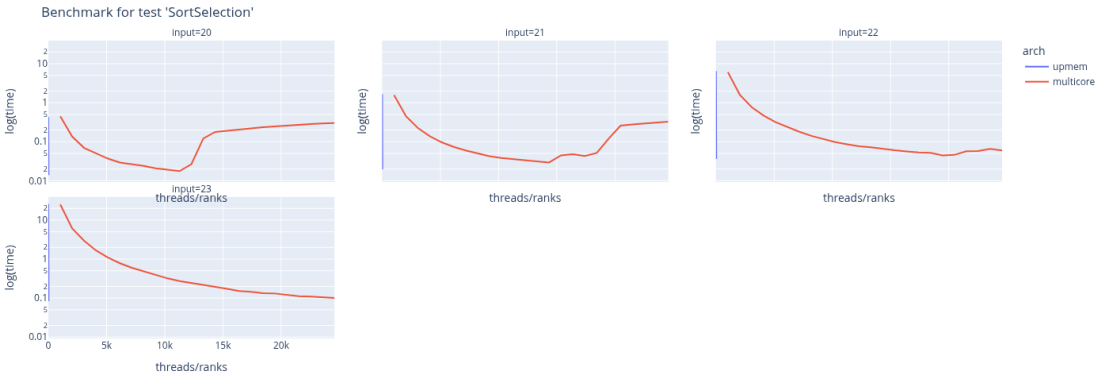

```
template<class ARCH>
struct SortSelection : bpl::Task<ARCH>
{
    struct Config  {
        static constexpr bool SWAP_USED          = true;
        static constexpr bool SHARED_ITER_CACHE  = false;
        static const bool VECTOR_SERIALIZE_OPTIM = false;
    };

    USING(ARCH,Config);

    using vector_t = vector<uint32_t>;
    using value_type = typename vector_t::value_type;
```

```
    decltype(auto) operator() (vector_t& v) const
    {
        for (size_t i=0; i<v.size(); i++)  {
            size_t k=i;
            value_type x = v[i];
            size_t j=i+1;
            for (auto it2=v.begin()+j; it2!=v.end(); ++it2, ++j)  { if (*it2<x)␣
↪{  k=j;  x=*it2;  } }
            swap (v[i], v[k]);
        }
        return v;
    }
};
```

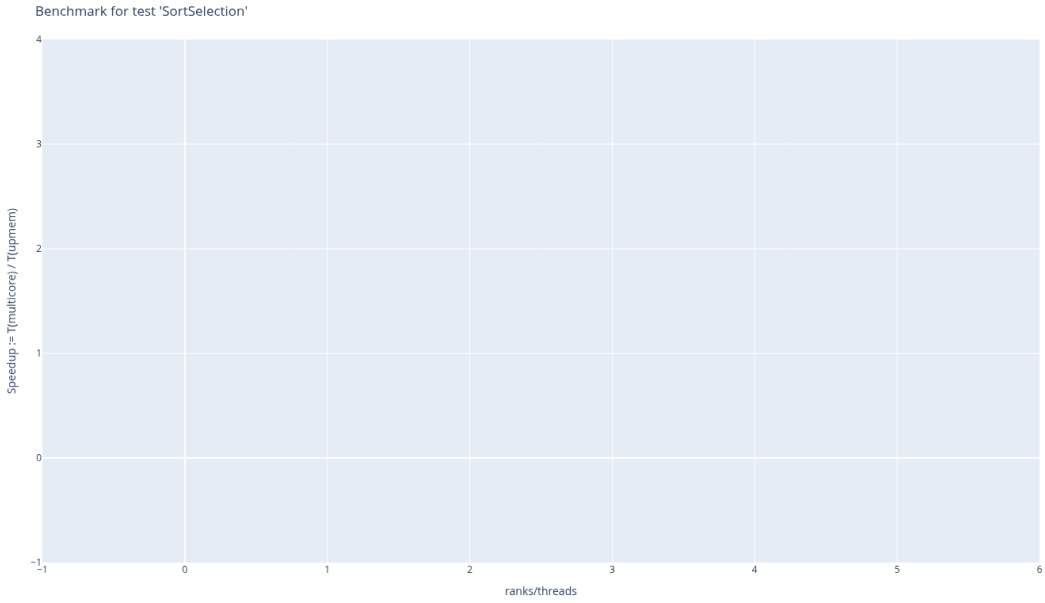

2.3.6 Multicore vs Upmem

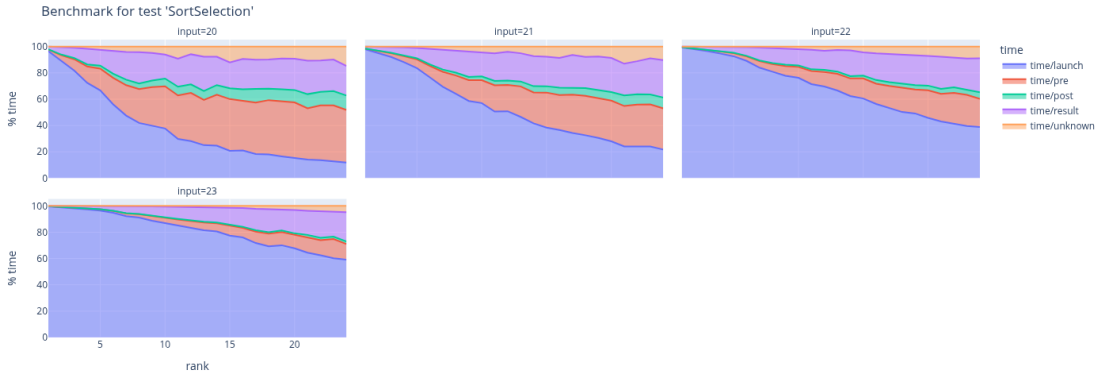

2.3.7 Scalability per architecture

2.3.8 Speedup upmem vs multicore

2.3.9 BPL overheads

2.4 Test 'SyracuseReduce'

2.4.1 Description

This test checks the Syracuse conjecture by computing the total stopping time for integers from 1 to N. Each task takes a range of integers and computes the

total stopping time T for each integer in the range. All results are reduced into a single integer and thus with low broadcast exchange.

2.4.2 Remarks

We both study the impact of pure calculus (ie. computing total stopping time) with potentially low result broadcast size.

2.4.3 Benchmark-input

2^n for n in range(20,31)

2.4.4 Benchmark-split

yes (range)

2.4.5 Source code

```
template<class ARCH>
struct SyracuseReduce : bpl::Task<ARCH>
{
    USING(ARCH);

    using range_t = pair<uint64_t,uint64_t>;

    auto operator() (range_t range) const
    {
        auto fct = [] (auto n) {
            size_t nb = 0;
            for ( ; n!=1; nb++)  {
                if ((n%2) == 0)  {  n = n/2;   }
                else             {  n = 3*n+1; }
            }
            return nb;
        };

        uint64_t result = 0;
        for (uint32_t n=range.first; n<range.second; ++n)  {
            result += fct(n);
        }
        return result;
    }

    static auto reduce (uint64_t a, uint64_t b)  { return a+b; }
};
```

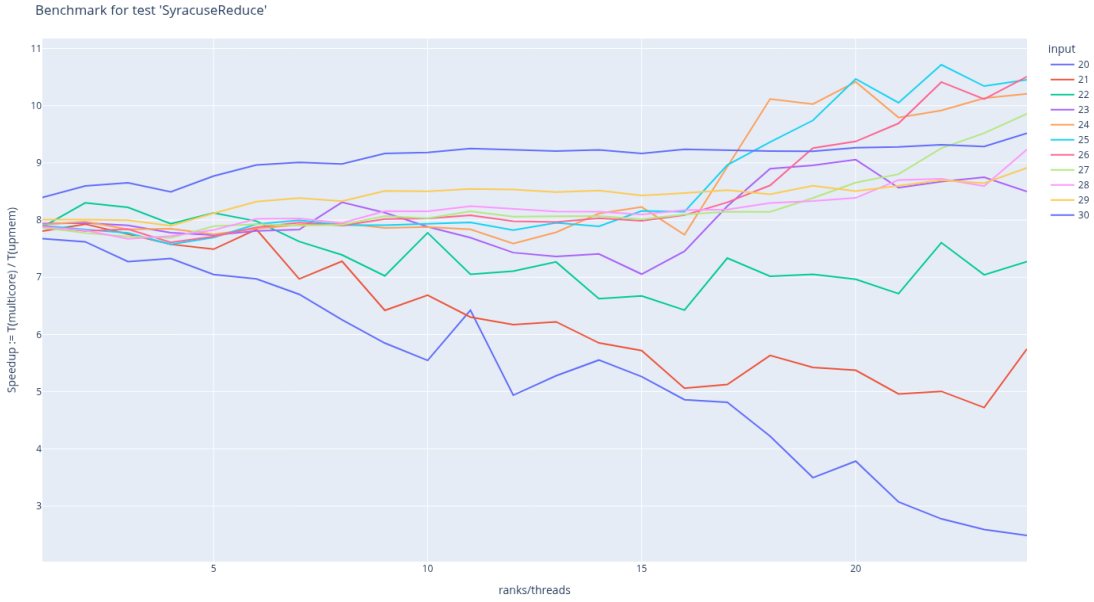

2.4.6 Multicore vs Upmem

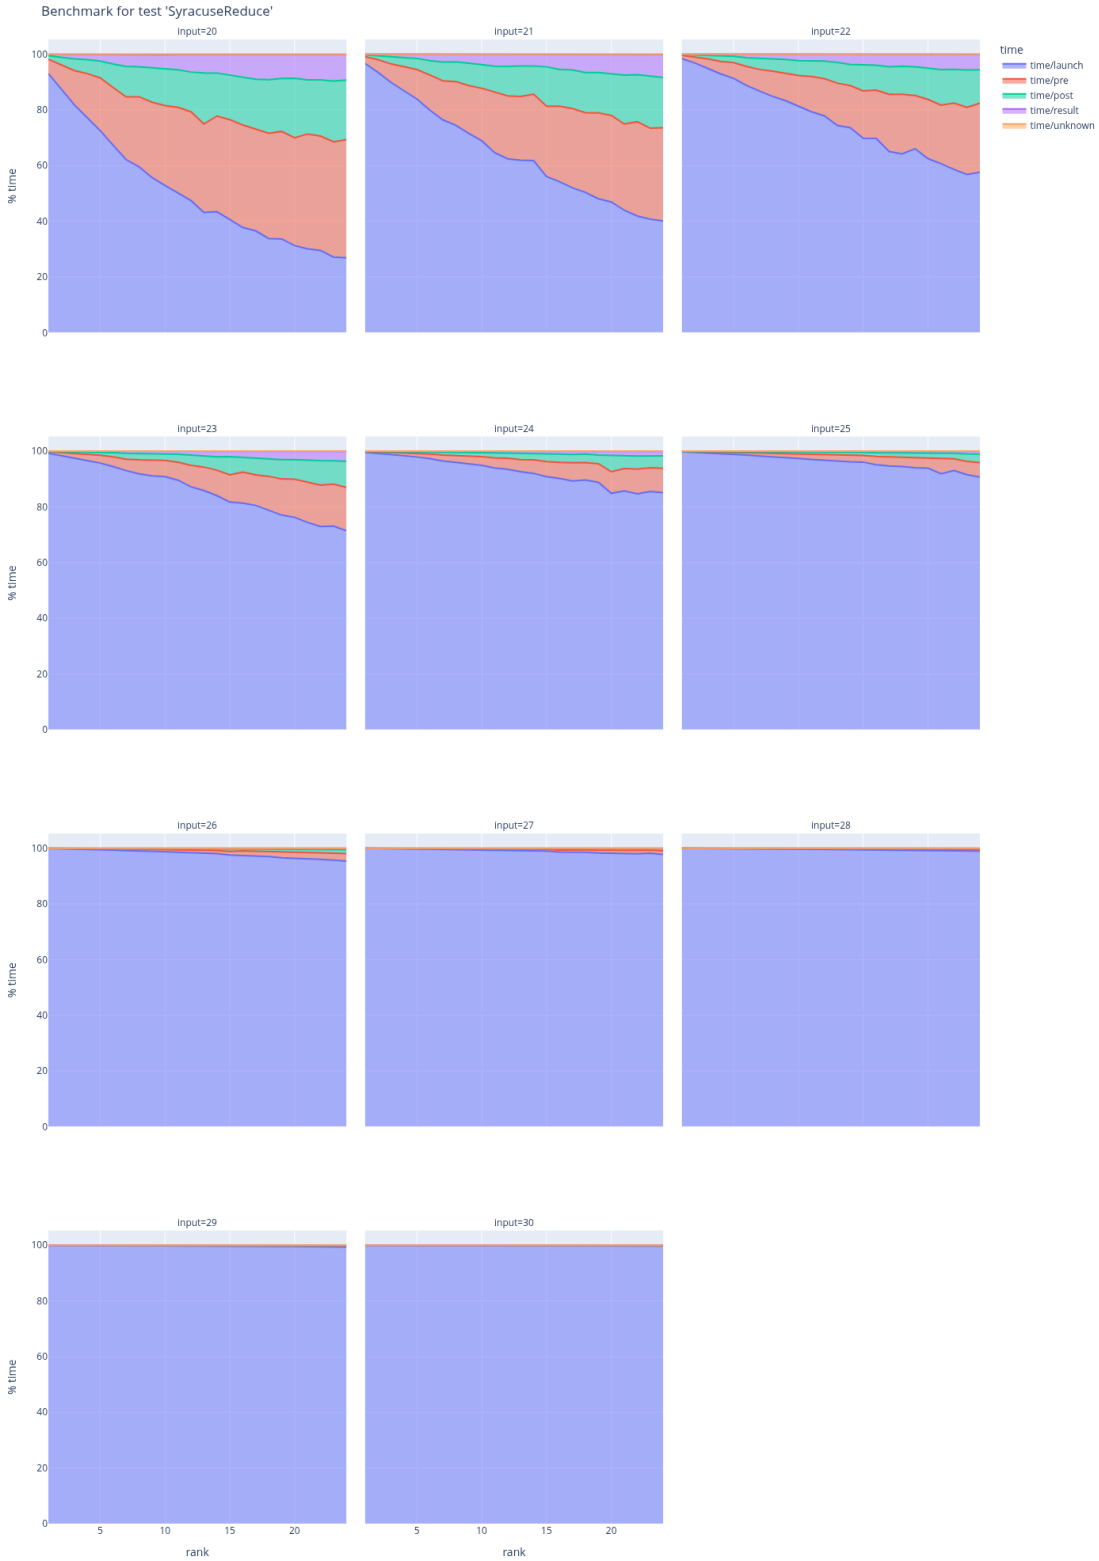

2.4.7 Scalability per architecture

2.4.8 Speedup upmem vs multicore

2.4.9 BPL overheads

2.5 Test 'SyracuseVector'

2.5.1 Description

This test checks the Syracuse conjecture by computing the total stopping time for integers from 1 to N. Each task takes a range of integers and computes the total stopping time T for each integer in the range. Each result is put into a vector that is returned as a result from the task.

2.5.2 Remarks

We both study the impact of pure calculus (ie. computing total stopping time) and building a potentially big vector as a result of the task.

2.5.3 Benchmark-input

2^n for n in range(20,29)

2.5.4 Benchmark-split

yes (range)

2.5.5 Source code

```
template<class ARCH>
struct SyracuseVector : bpl::Task<ARCH>
{
    struct config  {  static const bool VECTOR_SERIALIZE_OPTIM = true;  };

    USING(ARCH,config);

    using range_t = pair<uint64_t,uint64_t>;

    auto operator() (range_t range) const
    {
        vector<uint32_t> result (range.second-range.first);

        auto fct = [] (auto n) {
            size_t nb = 0;
            for ( ; n!=1; nb++)  {
                if ( (n%2) == 0) {  n = n/2;   }
                else             {  n = 3*n+1; }
            }
            return nb;
        };

        for (uint32_t n=range.first; n<range.second; ++n)  {
            result[n-range.first] = fct(n);
```

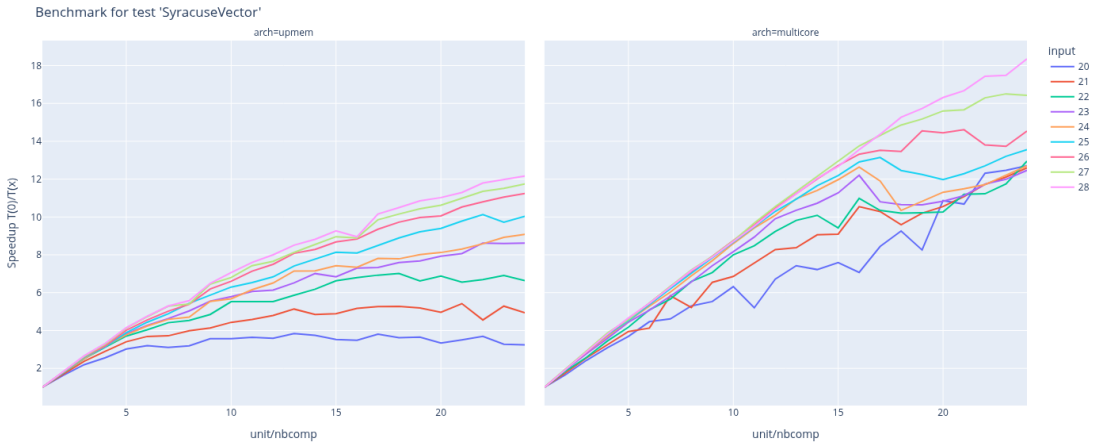

```
        }

        return result;
    }
};
```

2.5.6 Multicore vs Upmem

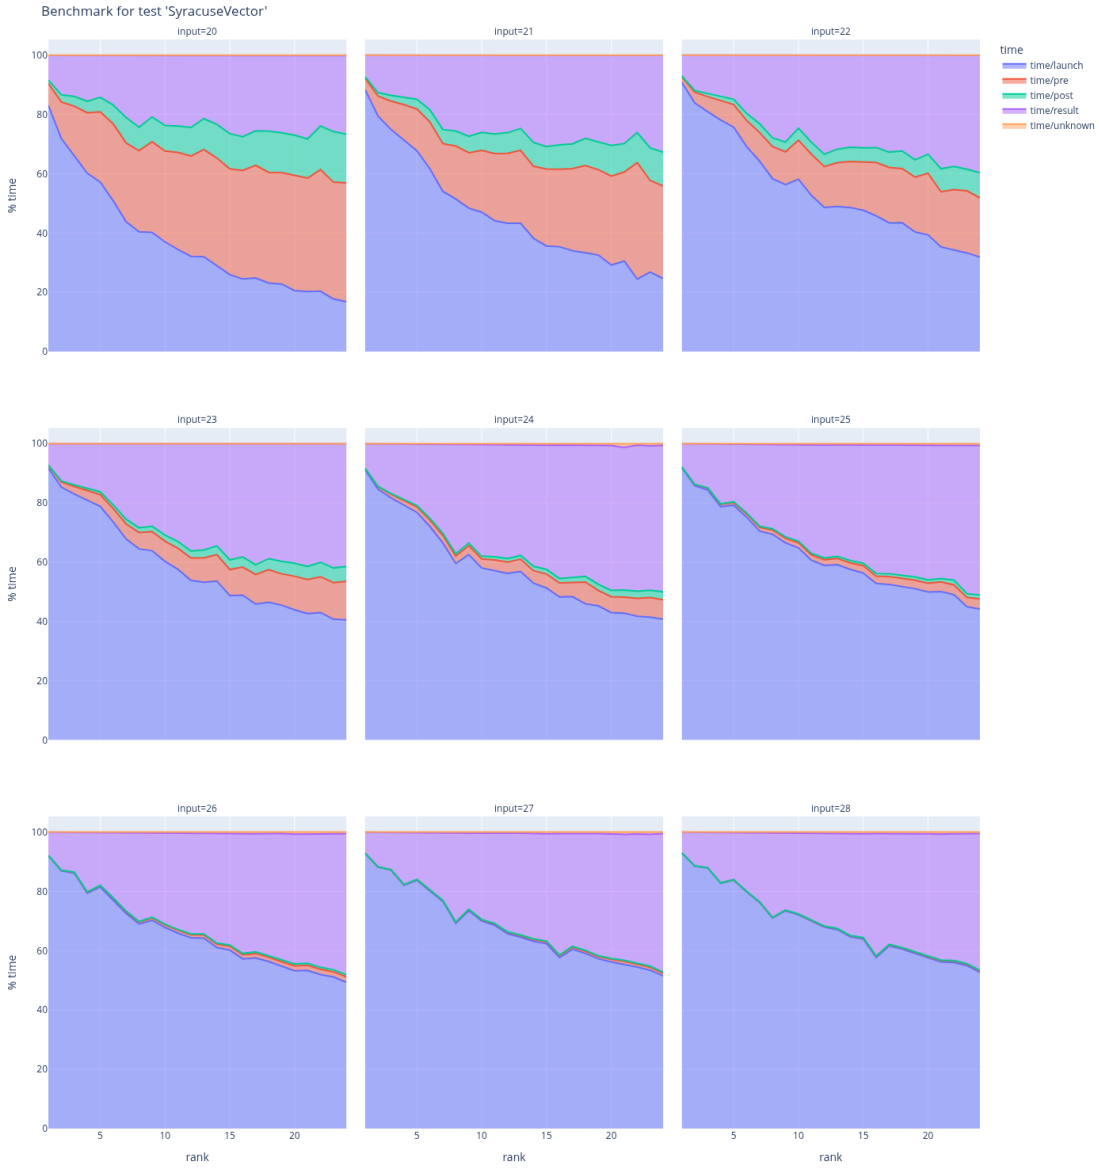

2.5.7 Scalability per architecture

2.5.8 Speedup upmem vs multicore

2.5.9 BPL overheads

2.6 Test 'VectorChecksum'

2.6.1 Description

Takes a vector as input, iterates its content and compute the checksum. The final result is reduced checksum.

2.6.2 Benchmark-input

2^n for n in 20,22,24,26,28

2.6.3 Benchmark-split

yes

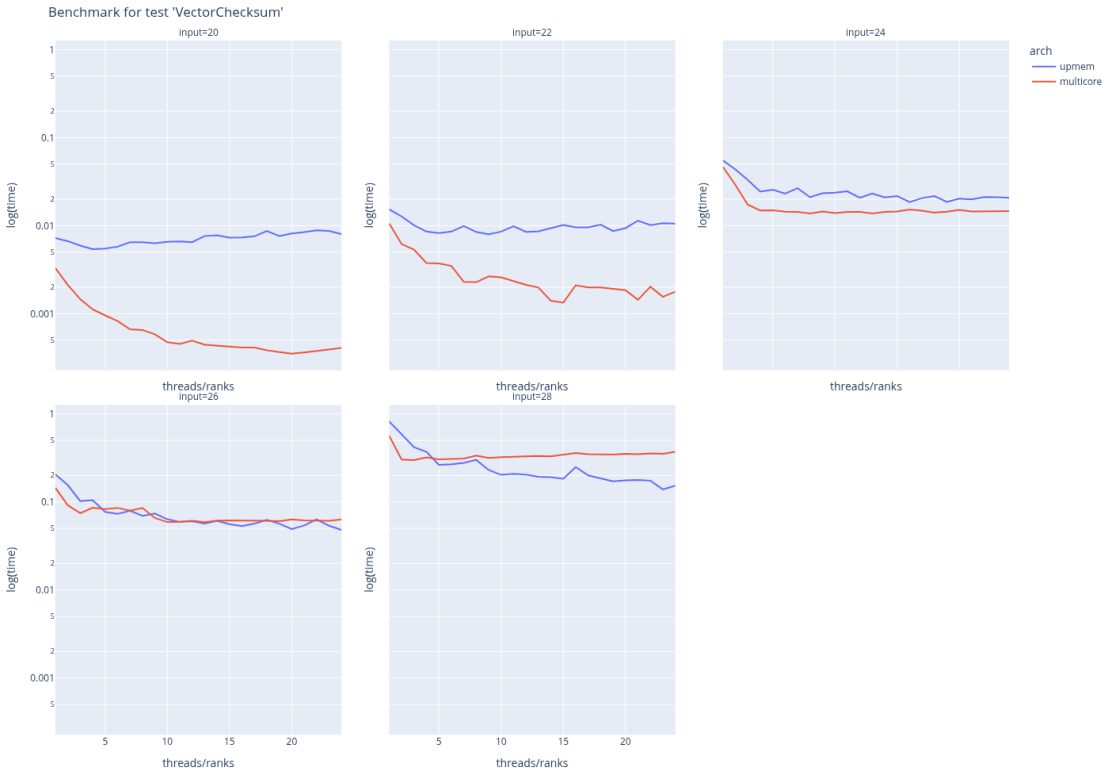

2.6.4 Source code

```
template<class ARCH>
struct VectorChecksum : bpl::Task<ARCH>
{
    USING(ARCH);

    auto operator() (vector<uint32_t> const& v)
    {
        uint64_t checksum = 0;
        for (auto x : v)  {  checksum += x;  }
        return checksum;
    }

    static uint64_t reduce (uint64_t a, uint64_t b)  { return a+b; }
};
```

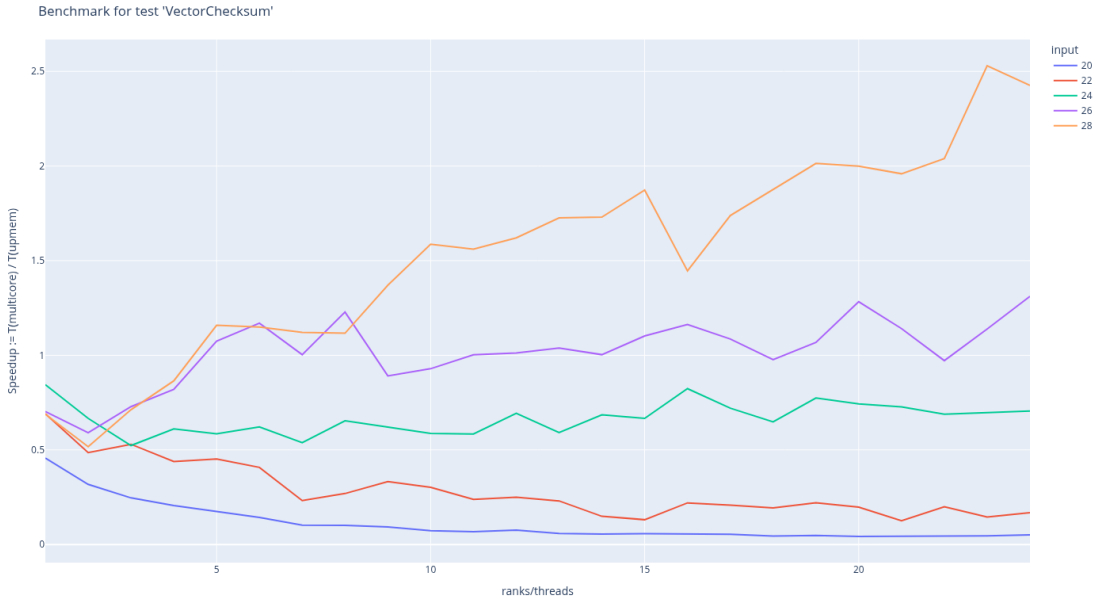

2.6.5 Multicore vs Upmem

2.6.6 Scalability per architecture

2.6.7 Speedup upmem vs multicore

2.6.8 BPL overheads

2.7 Test 'VectorChecksumOnce'

2.7.1 Description

Takes a vector as input, iterates its content and compute the checksum. The final result is reduced checksum. We tag the vector with 'once' in order to test successive calls

2.7.2 Remark

the first call is not used for time statistics in order to assess the impact of 'once'

2.7.3 Benchmark-input

2^n for n in 20,22,24,26,28

2.7.4 Benchmark-split

yes

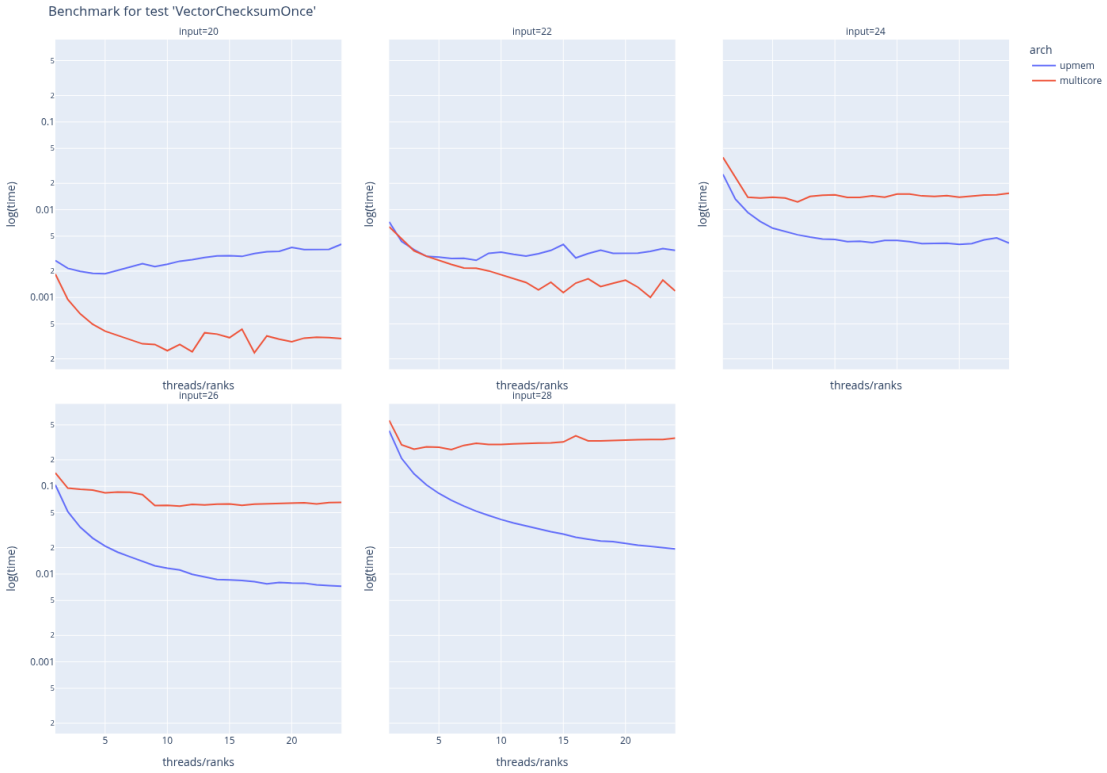

2.7.5 Source code

```
template<class ARCH>
struct VectorChecksumOnce : bpl::Task<ARCH>
{
    USING(ARCH);

    auto operator() (once<vector<uint32_t> const&> v)
    {
        uint64_t checksum = 0;
        for (auto x : *v)  {  checksum += x;  }
        return checksum;
    }

    static uint64_t reduce (uint64_t a, uint64_t b)  { return a+b; }
};
```

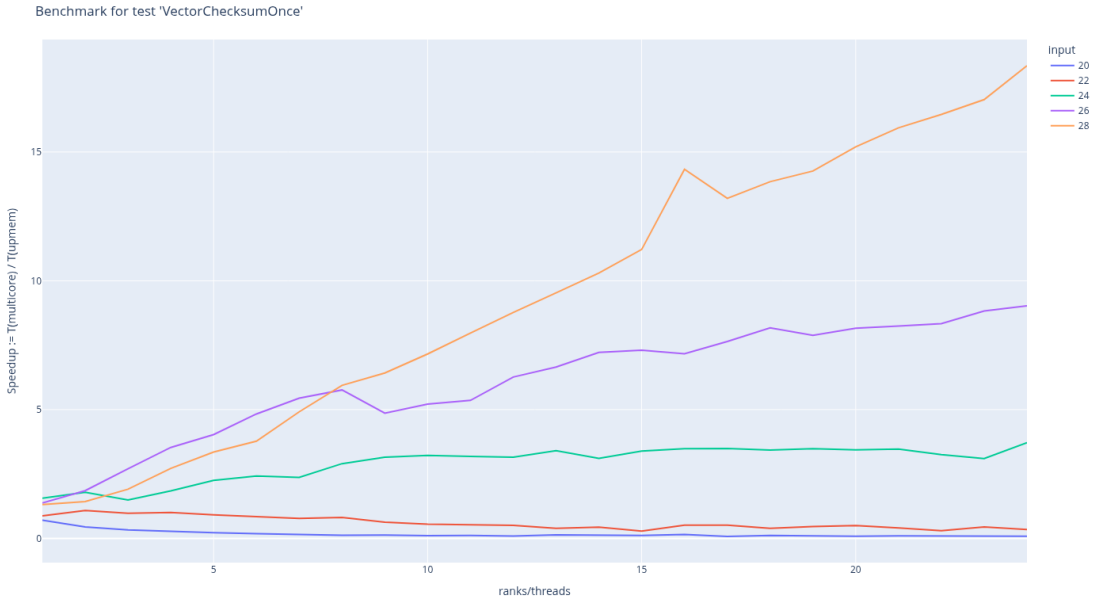

2.7.6 Multicore vs Upmem

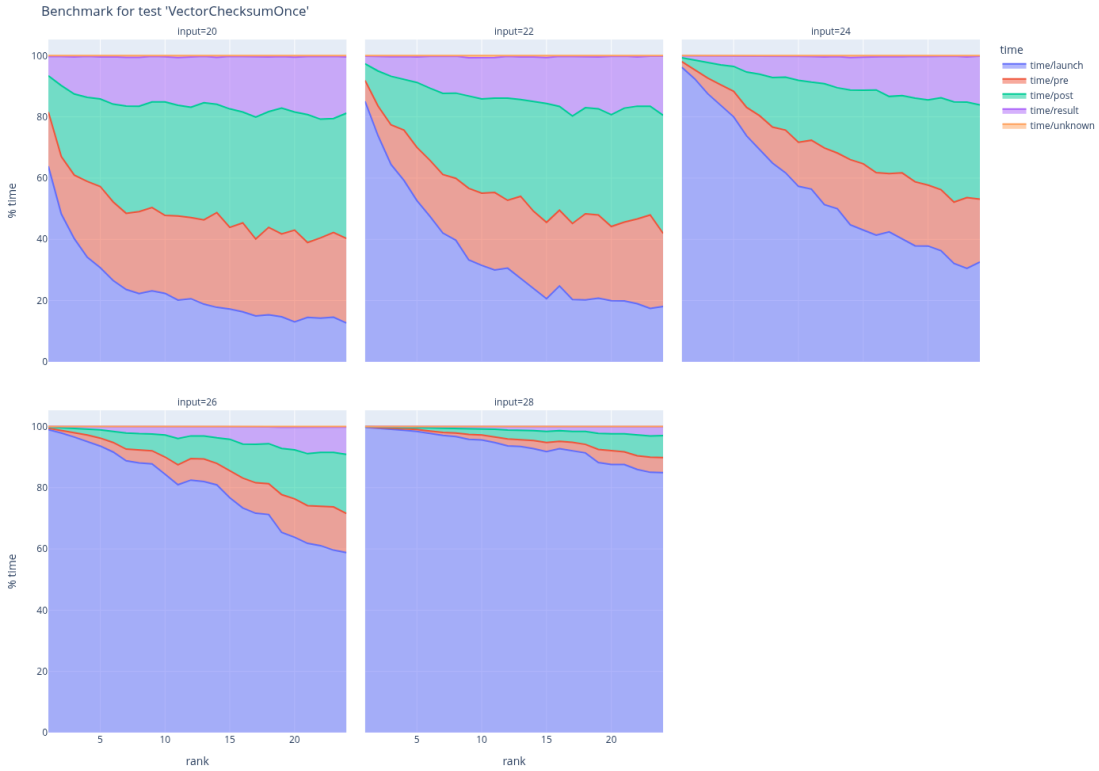

2.7.7 Scalability per architecture

2.7.8 Speedup upmem vs multicore

2.7.9 BPL overheads

2.8 Test 'VectorReverseInPlace'

2.8.1 Description

The task takes as input a (sorted) vector and reverses its items by swapping them

2.8.2 Benchmark-input

2^n for n in range(10,18)

2.8.3 Benchmark-split

yes

2.8.4 Source code

```
template<class ARCH>
struct VectorReverseInPlace : bpl::Task<ARCH>
{
    struct Config {
        static constexpr bool SWAP_USED = true;
```

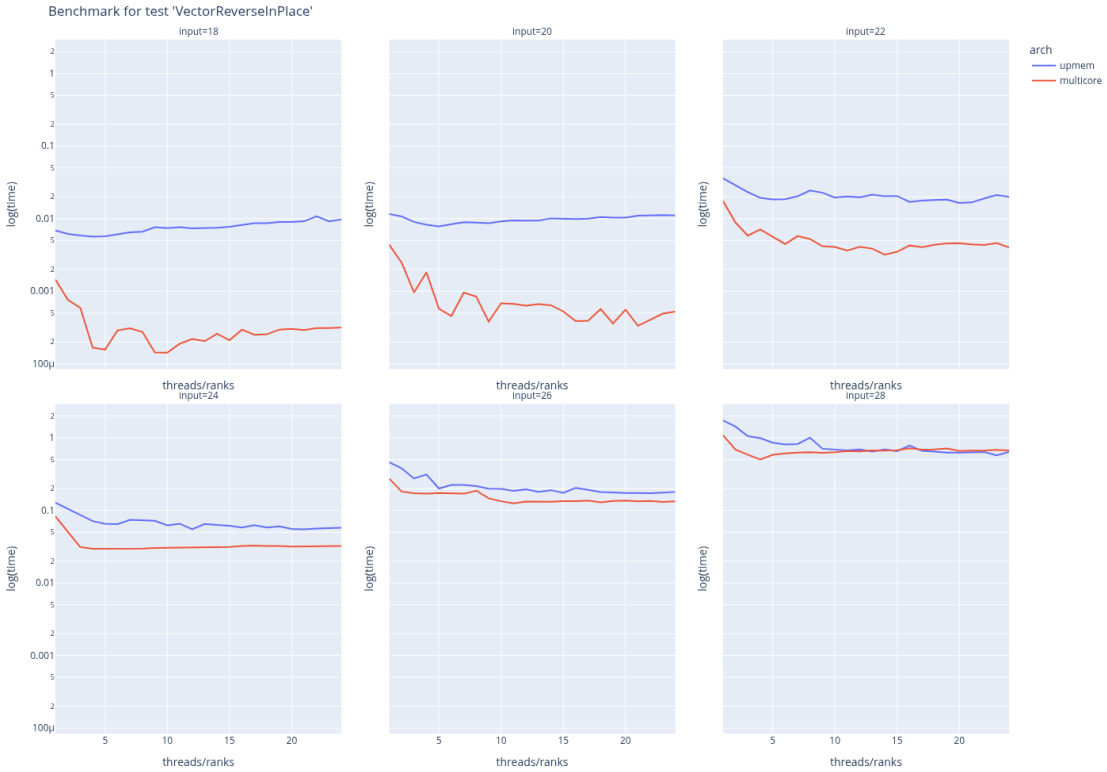

```
        static constexpr bool VECTOR_SERIALIZE_OPTIM = true;
    };

    USING(ARCH,Config);

    using value_type = int32_t;

    decltype(auto) operator() (vector<value_type>& v) const
    {
        for (size_t i=0; i<v.size()/2; i++)  {  swap (v[i], v[v.size()-1-i]); }
        return v;
    }
};
```
